UltraSonic®
Acoustic Panels

Installation Instructions:

Sound control applications can vary by room shape, size, and usage. The information listed below is a general purpose guide, intended to offer broad spectrum advice. A more detailed guide can be found online at www.bondedlogic.com.

1. **UltraSonic Acoustic Panels should be placed a minimum of 16” from the ceiling and floor, allowing for both aesthetic and performance advantages. When choosing placement, the most effective areas are the first points of sound reflection. An example includes wall surfaces that directly receive sound from a speaker. Be sure to include corner placements in your design, as these areas prove especially effective.**

2. **Once you have decided on placement of your panels, prepare the panels for mounting. The back of each panel has 2 keyhole shaped cutouts. Take some measurements, noting the position of the keyholes as they relate to the top edge of the panel. Hold the panel against the wall, marking the top edge with a pencil or other erasable material. Using the previous measurements, mark the areas where you will install the picture hangers of nails. The picture hanger or nail will be used to affix the panel to the wall.**

3. **Now that your panels and the wall surface are prepared for mounting, position the frame against the wall so that the picture hangers/nails in the wall meet the keyholes in the panel. Now that your panels have been installed, relax and enjoy improved acoustic conditions within the space that they are mounted!**
